

I notice the company name wasn't included in your application details. I'll write the cover letter with a placeholder you can easily swap out, but everything else will be tailored to the role and your background.

Dear Hiring Manager,

I'm excited to apply for the Lead Software Engineer – Full Stack role at [Company Name]. With over a decade of experience building and scaling full-stack SaaS platforms, I've spent my career doing exactly what this role demands: owning features end-to-end, from database design and API architecture through to polished frontend experiences, while helping engineering teams level up along the way.

During my time at Onclusive India (STG Labs), I worked extensively across Ruby on Rails backends and modern JavaScript frontends, building production systems that handled real scale. Whether that meant optimizing Elasticsearch queries to dramatically cut response times, architecting RESTful APIs consumed by EmberJS and React clients, or tightening up MySQL schemas under load, I've consistently taken ownership of the full picture rather than just my slice of it. At Reflektive Labs, I contributed to core product features across the stack while writing thorough RSpec test coverage that gave the team genuine confidence in deployments.

My time as Tech Lead at L&T; Technology Services shaped how I think about the engineering-product relationship. I learned that the best technical decisions aren't made in isolation — they're made with a clear understanding of what the product needs to accomplish and when. I bring that same mindset to mentoring: I'd rather help an engineer understand the "why" behind an architectural choice than just hand them an answer.

I'd love to bring this combination of deep hands-on experience and technical leadership to your team. I'm confident I can contribute meaningfully from day one while helping raise the bar for the engineers around me. Thank you for your time and consideration — I look forward to the opportunity to connect.

Sincerely,
[Your Name]
