

I notice the company name and full job description weren't included in your submission, so I'll write a strong cover letter based on the candidate profile provided. You'll want to swap in the actual company name and tailor any specific references to match the job description.

Dear Hiring Manager,

I'm excited to apply for the Senior Software Development Engineer role. With over 10 years of hands-on experience building and scaling full-stack SaaS platforms, I've spent my career doing exactly the kind of end-to-end engineering this position calls for — from crafting responsive frontend experiences to architecting the backend systems that power them.

At Onclusive India (formerly STG Labs), I took ownership of features across the full stack, working across Ruby on Rails APIs, Elasticsearch-driven data pipelines, and EmberJS/React frontends to deliver product experiences at scale. Earlier, at Reflektive Labs, I deepened my focus on performance optimization and production reliability — shipping features that balanced technical rigor with real product impact. These roles taught me that the best engineering decisions aren't made in isolation; they're made with a clear understanding of user needs, business goals, and system constraints all at once.

Beyond building, I've invested heavily in mentorship and team alignment. As a Tech Lead at L&T; Technology Services, I worked closely with junior engineers and cross-functional stakeholders to make sure architectural choices served both the immediate sprint and the long-term roadmap. I believe strong engineers make their teams stronger, and that's a principle I carry into every engagement.

I'd love to bring this combination of technical depth and collaborative ownership to your team. I'm confident my background across Rails, modern JavaScript, and scalable SaaS architecture maps closely to what you're looking for, and I'm eager to dig into the specifics of what you're building. Thank you for your consideration — I look forward to the conversation.

Sincerely,
[Your Name]
