

Dear Hiring Team at PulseRise Technologies,

I'm excited to apply for the Senior Software Engineer role focused on Java and Payments Infrastructure. While my core stack centers on Ruby on Rails, JavaScript, and full-stack SaaS development rather than Java, I bring over 10 years of building and scaling production backend systems — and I've consistently found that strong engineering fundamentals translate well across languages and domains. What drew me to PulseRise specifically is the opportunity to work on payments infrastructure, a space where reliability, correctness, and performance aren't optional — they're the entire product.

Across my roles at STG Labs/Onclusive India and Reflektive Labs, I've owned complex backend systems end-to-end: designing APIs, optimizing MySQL and PostgreSQL queries under load, integrating Elasticsearch for real-time data pipelines, and shipping features that touched everything from database schema to UI. At L&T; Technology Services as Tech Lead, I was responsible not just for delivery but for aligning technical decisions with broader product goals and raising the quality bar across the team through code reviews and mentorship. That combination of hands-on depth and technical leadership is something I'd bring directly to your engineering team.

I'm genuinely motivated to grow into the Java/payments space and am prepared to move quickly — the patterns around distributed systems, transactional integrity, and fault tolerance are ones I've navigated before, just with different tooling. I'd welcome the conversation to discuss how my background fits what you're building at PulseRise.

Thank you for your time and consideration.

Sincerely,
[Your Name]
