

Dear Hiring Team at Quik Hire Staffing,

I'm excited to apply for the Backend Engineer (Remote) role. With over 10 years of hands-on experience building and scaling full-stack SaaS platforms, I've spent my career doing exactly what this role demands — owning features end-to-end, from database design and API architecture through to frontend delivery and production deployment. My core stack aligns closely with yours: Ruby on Rails, MySQL, JavaScript (ES6), and modern frontend frameworks including React and EmberJS.

During my time at Reflektive Labs and Onclusive India, I built and maintained high-traffic backend systems using Ruby on Rails with Elasticsearch and MySQL, writing thorough RSpec test coverage and optimizing queries that meaningfully improved application performance at scale. At L&T; Technology Services as Tech Lead, I bridged the gap between engineering decisions and product goals — a balance I genuinely enjoy — while mentoring junior engineers and driving architectural consistency across the team. These experiences gave me a strong instinct for when to move fast and when to slow down and do it right.

What draws me to this opportunity is the chance to contribute at a staff level where both technical depth and cross-functional ownership matter. I'm comfortable picking up a ticket that spans a Rails API, a MySQL schema change, and a React or EmberJS component, and I take pride in leaving codebases cleaner than I found them.

I'd love to connect and talk through how my background fits what you're building. Thank you for your time and consideration.

Sincerely,
[Your Name]
