

Dear Hiring Team at Wand,

I'm excited to apply for the Senior Backend Engineer role. With over 10 years of building production-grade SaaS platforms end-to-end, I've developed deep expertise in the exact stack your team relies on — Ruby on Rails, MySQL, and modern JavaScript — and I thrive in environments where engineering decisions need to move fast without sacrificing quality.

At Onclusive India (via STG Labs), I owned full feature cycles from database schema design through backend APIs to frontend delivery in EmberJS and React, working on a platform that processed large volumes of media data using Elasticsearch. I've consistently optimized slow queries, reduced API response times, and shipped features that scaled. At Reflektive Labs, I worked as part of a product-focused engineering team building performance management SaaS, where writing clean, well-tested Rails code with RSpec wasn't just expected — it was the baseline. These experiences taught me how to balance velocity with maintainability, something I care about deeply.

Beyond the technical work, I've mentored junior engineers and led technical direction as a Tech Lead at L&T; Technology Services, helping teams align their day-to-day engineering choices with broader product goals. I understand that senior engineers aren't just individual contributors — they raise the quality of everything around them.

Wand's focus on building something genuinely new and ambitious is exactly the kind of challenge I'm looking for. I'd love to bring my backend depth, full-stack range, and product-minded approach to your team. Thank you for considering my application — I'd be glad to discuss how I can contribute.

Warm regards,
[Your Name]
