

Dear Hiring Team at Jobright.ai,

I'm excited to apply for the Senior FullStack Developer role at Jobright.ai. Building AI-powered tools that genuinely improve how people find work is meaningful work, and the technical challenges that come with scaling a product like yours — real-time data, intelligent matching, seamless user experience — are exactly the kind I thrive in. With over 10 years of hands-on experience building and owning full-stack SaaS platforms, I believe I can contribute meaningfully from day one.

Throughout my time at Onclusive India and Reflektive Labs, I've worked across the full stack in environments that closely mirror what Jobright.ai is building — Ruby on Rails backends, Elasticsearch-powered search and data pipelines, MySQL databases, and modern JavaScript frontends. At Reflektive, I owned features end-to-end, from UI through to API design and production deployment, optimizing performance under real user load. At Onclusive, I worked on large-scale data systems where query efficiency and backend reliability weren't optional — they were the product. These experiences have sharpened my instinct for writing code that doesn't just work, but holds up.

As a Tech Lead at L&T; Technology Services, I also learned that strong engineering isn't just about individual output — it's about raising the quality of the team around you. I've mentored junior developers, driven code review culture, and helped align technical decisions with product priorities. That balance between hands-on execution and broader technical leadership is something I actively enjoy and look to bring to a senior role.

I'd love the opportunity to talk about how my background maps to what you're building at Jobright.ai. Thank you for your time and consideration.

Sincerely,  
[Your Name]
