

Dear FutureFeed Hiring Team,

I'm excited to apply for the Senior Software Engineer role at FutureFeed. With over 10 years of full-stack engineering experience building and scaling SaaS platforms, I've spent my career doing exactly what this role demands — owning features end-to-end, from database design and Rails APIs through to polished frontend experiences, while helping teams ship with confidence. The combination of Rails, modern JavaScript, and cloud infrastructure work you're describing is squarely in my wheelhouse, and I'm genuinely drawn to the mission and product FutureFeed is building.

In my time at STG Labs / Onclusive India, I worked as a Senior Software Engineer on large-scale SaaS products where I contributed across the full stack — building robust Ruby on Rails backends, optimizing Elasticsearch queries for performance at scale, and developing frontend features in React and EmberJS. I've grown comfortable navigating complex codebases and making pragmatic architectural decisions that balance speed of delivery with long-term maintainability. At Reflektive Labs, I deepened my experience with MySQL and PostgreSQL-backed systems while taking ownership of critical product features from initial scoping through production deployment.

Beyond individual contribution, my time as Tech Lead at L&T; Technology Services sharpened my ability to mentor engineers, align technical decisions with product priorities, and drive consistency in code quality through strong RSpec test coverage and thoughtful code reviews. I understand that at the senior level, your impact multiplies through the people around you — not just the code you personally write.

I'd love the opportunity to bring this depth of experience to FutureFeed and contribute to what you're building. Thank you for your time and consideration — I look forward to the chance to connect.

Sincerely,
[Your Name]
