

Dear Hiring Team at RemoteHunter,

I'm excited to apply for the Software Engineer II role. With over 10 years of full-stack engineering experience, I've spent my career doing exactly what this role demands — owning features end-to-end, from database design and API architecture through to polished frontend interfaces, and shipping them into production with confidence. My background across Ruby on Rails, JavaScript, MySQL, and modern frontend frameworks maps closely to what you're looking for, and I'm drawn to the opportunity to contribute at a company built around the future of remote work.

At Onclusive India (via STG Labs), I worked extensively on a large-scale SaaS media intelligence platform, building and maintaining backend systems in Ruby on Rails backed by Elasticsearch and MySQL, while also contributing to frontend experiences in modern JavaScript. I developed a strong habit of treating performance seriously — whether that meant optimizing slow queries, improving indexing strategies, or reducing frontend bundle sizes. At Reflektive Labs, I owned the delivery of key product features across the full stack, collaborating closely with product managers to translate business goals into clean, testable, maintainable code using RSpec-covered Rails services and React-driven UIs.

Beyond the technical work, my time as Tech Lead at L&T; Technology Services sharpened my ability to mentor engineers, drive code quality standards, and make architectural decisions that balance pragmatism with long-term maintainability — skills I consider just as important as writing good code.

I'd love to bring this combination of hands-on depth and product-minded thinking to the RemoteHunter team. Thank you for considering my application, and I look forward to the opportunity to connect.

Sincerely,
[Your Name]
