Re: Staff Product Engineer - LawnStarter

LawnStarter's bet ? that 1?2 engineers leading AI agents can outship entire labor teams ? is exactly the model I've been moving toward in my own work, and the Staff Product Engineer role is where I want to put that conviction to the test. Building the infrastructure that powers a three-brand, \$100M+ marketplace with real customers and real pros on both sides is precisely the kind of high-stakes, outcome-driven environment where I do my best work.

Over the past decade I've owned features end-to-end across Ruby on Rails backends, Elasticsearch-powered search and ranking layers, MySQL data models, and React and EmberJS frontends ? without handing off at the seams. At STG Labs / Onclusive India, I led the redesign of a core data pipeline that cut query latency by over 60% through targeted Elasticsearch index tuning and Redis-backed caching, directly improving the reliability metrics the product team cared about. Earlier at Reflektive, I architected a background-job system using Sidekiq that processed millions of performance-review events per day with near-zero queue backlog ? a change that unblocked a PM-led initiative that had been stalled on throughput for months. In both cases I was accountable not just for the merged code but for whether the metric actually moved, which is the only accountability model that makes sense to me.

I'm actively working with Claude Code, Cursor, and LangGraph-based agent workflows, and I've started integrating RAG pipelines backed by vector stores into production features ? so the agent-led model LawnStarter is building around isn't a concept I'm learning from scratch, it's a direction I'm already running. My background across distributed systems, CI/CD pipelines on GitHub Actions, infrastructure-as-code with Terraform, and observability tooling like AppSignal and New Relic means I can keep agents operating safely and catch regressions before they reach real customers or pros.

I'd love to talk through a specific initiative where LawnStarter needs an engineer who can anchor the full triangle ? from shaping the problem with a PM to owning the metric review after launch. I'm ready to move quickly if the fit is there.
